Ethanol-induced alterations in the activity of 3',5'-cyclic adenosine monophosphate-dependent protein kinase in cerebellar granule cells. Cerebellar granule cells were treated in vitro with ethanol, and changes in the activity of the cyclic adenosine monophosphate (cAMP)-dependent protein kinase (PKA) were measured. Cells were incubated with ethanol (100-500 mM) for 1 hour or exposed to 100 mM ethanol acutely followed by treatment with 100 microM of 8-bromo-cAMP (8-Br-cAMP) for 20 min. Analysis of PKA kinase activity by measuring the incorporation of labeled phosphate into protein histone from a cAMP-dependent histone kinase activity revealed that following chronic treatment with ethanol, cells showed no significant change in cAMP-dependent histone kinase activity compared to controls. By contrast, acute treatment with ethanol (100 mM) increased PKA kinase activity by 20-60% when measured in crude synaptic extracts. The increase in PKA activity was similar to that observed in response to a potent PKA activator, 8-Br-cAMP. In response to treatment with ethanol, there was also a significant increase in cAMP content in cerebellar cells. Thus, ethanol may activate PKA by a mechanism that does not involve changes in cAMP concentration. The relationship between the increase in PKA kinase activity and the increase in cAMP content remains to be determined.

Q: What is the difference between `GetGenericTypeDefinition`, `GetType().GetGenericTypeDefinition`, `Type.GetGenericTypeDefinition` and what is the right way? For some of my classes I have a `TryGetCustomAttributes` method that take an `IEnumerable` as an argument. My understanding is that `GetType()` returns a compile-time type:

`Console.WriteLine(typeof(string).GetType().GetGenericTypeDefinition().Name);` The above code prints the string generic type definition, `(string)`. I can also do: `Console.WriteLine(typeof(string).GetGenericTypeDefinition().Name);` The above code prints the same: `System.String`. I can also do: `Console.WriteLine(typeof(string).GetGenericTypeDefinition());` The above code prints the string generic type definition. And I can do: `Console.Write`

Q: Get the JavaScript object methods Is there a way to get the functions/properties of a JavaScript object that are not exported by default? For example say that I have an object like: `var o = { s: "s", makeIt: function(){ return s + " " + s; }, //Want the function makeIt cb: function(){ console.log("hello"); } }` Now if I invoke `o.cb()` without using any arguments (and with the proper scope) I would like the function to be printed in the console. This is similar to the way the following works:

`Function.prototype.__lookupGetter__ = function(){}; var o = { a: function(){console.log("a")}, b: 1 }; o.a(); //prints "a"` The different between the above and my example is that I would like to get to the function that the object defines that is not exported. To be clear this is not the correct approach: `var o = { x: function(){console.log("x")}, y: 1 }; o.x; //doesn't work o.y; //doesn't work` If this is not possible how would one design such a library? A: In your case you can just use `o.makeIt`. If you're trying to get the lexically scoped function name (i.e. you want `o.makeIt` instead of `o.makeIt`), you can use a function lookup function. `function lookup(parentScope, functionName, object) { var value = object[functionName]; if (typeof value == 'function') { return value; } else { return null; } } if (lookup(o,'makeIt', o)) { alert(lookup(o`
